**OREGON**

**Summary:** This 2020-21 profile of Oregon's public K-12 school finance system focuses on three core indicators: fiscal effort, statewide adequacy, and equal opportunity. On a weighted average of these three measures, with performance assessed relative to that of other states (see back). Oregon scores 66 out of 100, which ranks 13th out of the 48 states with possible ratings.

### Fiscal Effort

Fiscal effort is a measure of how much states devote to their schools as a share of their economic capacity (i.e., ability to raise revenue). Effort is calculated by dividing direct state and local K-12 expenditures in each state by its gross state product (GSP).

RATING RELATIVE TO OTHER STATES (HIGH I MEDIUM I LOW):
- OR is a high effort state.

<table>
<thead>
<tr>
<th>Fiscal effort summary</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Oregon effort</td>
<td>3.84%</td>
</tr>
<tr>
<td>U.S. average effort</td>
<td>3.53%</td>
</tr>
</tbody>
</table>

- OR spends 3.84 percent of its economic capacity (gross state product) on its K-12 public schools.
- This effort level is 0.30 percentage points higher than the unweighted U.S. average of 3.53 percent (rank #15 of 50).

### Statewide Adequacy

Statewide adequacy compares actual per-pupil (PP) spending in each state to estimates of the amount adequate to achieve the modest goal of U.S. average test scores. The graph to the right compares this state with other states in terms of the percentage of students in below adequate districts (spending is below adequate) and the percentage in chronically below adequate districts (the top 20% largest negative gaps nationally).

RATING RELATIVE TO OTHER STATES (HIGH I MEDIUM I LOW):
- Statewide adequacy in OR is high.

- The typical OR student’s district spends 8.9% above adequate levels (rank #15).

### Equal Opportunity

Equal opportunity compares adequacy between states’ higher- and lower-poverty districts. The graph on the right presents adequate funding gaps (as a %) by district poverty quintile (the teal diamonds are U.S. averages). The difference (in pct. points) between the (weighted) average gap of the two lowest-poverty and the two highest-poverty groups is a state’s “opportunity gap.”

RATING RELATIVE TO OTHER STATES (HIGH I MEDIUM I LOW):
- Equal opportunity in OR is medium.

| Adequacy gaps (%) by district poverty |
|--------------------------------------|----------|
| A. Low/lowest poverty districts      | 24.3%    |
| B. High/highest poverty districts    | -12.2%   |
| C. Opportunity gap (B minus A)       | -36.5 pts|

- OR’s opportunity gap of -36.5 points is ranked #21 out of 48 (#1 = most equal).
The data in this state profile are from the School Finance Indicators Database (SFID), a collection of public K-12 school finance and resource allocation indicators published annually by researchers from the Albert Shanker Institute, University of Miami School of Education and Human Development, and Rutgers University Graduate School of Education. The primary product of the SFID is the State Indicators Database (SID), a state-level dataset containing roughly 125 variables. This profile focuses on three types of measures included in the SID: fiscal effort, statewide adequacy, and equal opportunity.

**Fiscal effort**

Fiscal effort indicates how much of a state's total economic capacity goes toward K-12 schools. It is calculated in the SFID by dividing direct state and local K-12 expenditures by either Gross State Product (GSP) or aggregate state personal income (API). GSP and API are measures of a state's economic capacity. In this sense, effort measures how much each state contributes as a percentage of how much it might contribute. We present GSP-based effort in these profiles, but the two are highly correlated, and the API-based effort indicator is available in the SID. Bear in mind that high-capacity states, such as New York and California, can put forth lower effort than lower capacity states, such as Mississippi and Alabama, but still produce the same funding. We therefore use effort primarily as a means of differentiating between low/inadequate funding states that do and do not have the capacity to increase revenue.

- **U.S. effort averages are unweighted and do not include Vermont in any year (effort not available in 2018-21 due to data irregularities), so as to keep a consistent set of states across years.**
- **We characterize each state's effort below adequate funding levels based on their effort levels (using terciles). Note that even seemingly small changes or differences in effort levels represent large revenue amounts, as the denominators are entire state economies.**
- **The table in the right panel summarizes the center-panel graph, with a focus on effort trends before and after the 2007-09 recession. The 2006-12 period (the “K-12 recession”) is highlighted in the table (rather than, say, 2006-09) because the direct impact of the recession on K-12 funding in the typical state persisted for a few years after the “official recession” ended, and because federal stimulus funds ran out after 2011. 2012 is therefore an apt starting point for assessing states’ reinvestment (or lack thereof). Trends, however, vary by state.**
- **In the third bullet of the right panel, below the table, we present a “thought experiment” of sorts, in which we calculate how much additional total state and local spending each state would have had between 2016 and 2021 had that state returned to its own pre-recession (2006) effort level by 2016 (with 2012-2016 representing a reasonable time period for full recovery). For each state/year combination in which 2016-21 effort exceeded the state’s 2006 level, the hypothetical additional spending is zero (i.e., the hypothetical additional funding estimates do not include years in which 2016-21 funding would have been lower under states’ 2006 effort levels).**
- **In order to provide a sense of state’s capacity, we characterize each state’s GSP per capita as small, medium, or large by sorting states into three groups using terciles.**

**Statewide adequacy**

Adequacy is typically defined as the extent to which the amount of funding for schools is sufficient for students to reach a minimum/acceptable level of educational outcomes. Our adequacy estimates compare each district's actual spending levels to estimates from cost models of how much that district would have to spend in order to achieve national average test scores (i.e., “required” or “adequate” spending). We express statewide adequacy in three ways: 1) the proportion of students in each state in districts with actual funding below estimated adequate spending levels; and 2) the proportion of students in chronically below adequate districts (see below); and 3) the adequacy gap (percentage difference between actual and estimated adequate spending) for the typical student in each state. All these estimates are from the National Education Cost Model (NECM), which is part of the SFID. The NECM calculates required spending based on the relationship between outcomes and cost factors such as regional wage variation, district size, and student characteristics. Given the imprecision inherent in comparing both finance and testing data between districts in all states, as well as the fact that we set a modest common outcome goal (average test scores), our adequacy estimates are most appropriate when comparing common outcome variables about the NECM, see the SID user’s guide (also see: our adequacy estimates are all percentages). The other markers (percent in below adequate districts) require use of the SFID's District Cost Database (DCD); all SID adequacy measures (all of which have variable name beginning with necm_ ) are aggregations of DCD estimates. The full DCD dataset (going back to 2009) is also publicly available at the SID website (2021 estimates will be released in early 2024).

- **Statewide adequacy estimates are not available for Hawaii in all years (due to it being a geographically isolated, single-district state), and for Vermont between 2017 and 2021 (due to data irregularities). Estimates for D.C. apply to a single school district (District of Columbia Public Schools).**
- **We characterize each state’s statewide adequacy as low, medium, or high by averaging within-year z-scores for percent above adequate and average funding gap and dividing states into three groups using these average z-scores (terciles).**
- **“Chronically below adequate” districts are those with funding gaps (percent difference between actual and adequate funding) among the 20 percent largest in the nation.**
- **The regional and U.S. averages in the middle graph (the teal and gold diamonds, respectively) are unweighted—i.e., they represent adequacy in the typical state, not the typical student.**
- **The trend graph in the right panel presents the average statewide adequacy gap (the percentage difference between actual and estimated adequate funding for the typical student) normalized within each year (converted to standard deviations) such that the average is zero. This allows for more appropriate comparisons over time. In the first bullet of this panel, states’ net changes between 2011 and 2021 are characterized as “substantial” if the absolute change exceeds 0.3 s.d., “modest” if the absolute change is between 0.05 and 0.3 s.d., and “no more or less adequate” if the absolute change does not exceed 0.05 s.d. Axes ranges for this graph are expanded in a handful of states.**

**Equal opportunity**

Equal educational opportunity is achieved in a given state when none of that state’s districts are substantially further above or below adequate spending levels than are other districts. In the SFID, we measure equal opportunity (EO) with the same NECM estimates used for statewide adequacy (see above), but in this case by comparing adequacy gaps (percentage difference between actual and estimated adequate spending) between the two highest- and the two lowest-poverty districts in each state (i.e., a weighted average of the “highest” and “highest” poverty quintiles and a weighted average of the “lowest” and “low” poverty quintiles). Each state’s “opportunity gap” is the difference (in percentage points) between these two groups. Note that EO is conceptually independent of statewide adequacy—e.g., a hypothetical state in which all districts are below adequate funding levels might still exhibit EO, so long as high- and low-poverty districts are adequately funded. In this sense, where funding is chronically inadequate, if high-poverty districts are more adequately funded than low-poverty districts. Statewide adequacy and equal opportunity as we define them are independent concepts.

- **EO estimates are not available for Vermont and Hawaii and cannot be calculated for D.C. (single government-run district state).**
- **We characterize each state’s degree of equal opportunity as low, medium, or high by sorting states into three groups based on their opportunity gaps (using terciles).**
- **The center panel figure presents adequate funding gaps for all five quintiles in each state (although opportunity gaps as we define them for the purposes of this profile use only the two highest- and the two lowest-poverty quintiles). The gray bars and the blue dots represent different combinations of quintiles.**
- **The scatterplot in the right panel presents, by district poverty quintile, adequacy (difference between actual and required spending) expressed in dollars per pupil (horizontal axis) by average student test outcomes expressed as the difference from the national average in standard deviations (vertical axis). The student outcome data are for 2019, the latest available year in the Stanford Education Data Archive (some districts’ values are imputed). The other markers (hollow circles) in the plot are other states’ district poverty groups (color coded in the same manner, but with more transparent markers to allow for clear viewing of this state’s markers). The difference in student outcomes between the highest- (Q5) and lowest-poverty (Q1) estimate is presented in the first bullet, below the plot, and can be interpreted as a poverty-based student achievement gap in this state. Note that this gap compares different groups than does our opportunity gap measure. Axes ranges for this graph are expanded in a handful of states.**
